How to connect sensing phase to generator output voltage?

For generator output voltage 220Vac ,connect sensing phase to terminal V 220. For generator output voltage 400Vac ,connect sensing phase to terminal V 380 . The sensing should be connected "Line to Line" from generator output. Refer Figure 3 &4. 2. F+. F- : Excitation Output . 6. A1 - A2 : Analog Voltage Input.

How do I adjust the voltage on a 50Hz generator?

( For 50Hz applications, the frequency "roll-off" is factory preset to 45Hz, for 60Hz operation, the frequency is 55Hz). Adjust the front panel VOLT to vary the generator nominal voltage. If used, a 10000 1 watt potentiometer may be connected to terminals EXT VR, refer to Figure4.

How do you flash a generator?

Refer to field flashing section in generator manual. Slowly adjust voltage potentiometer until the generator voltage reach the proper value. Turn the stability potentiometer clockwise until instability is shown, and then turn it anticlockwise slightly still both meter mention in (5) and (6) shown stable.

How do I adjust the UFRO Trimmer?

Adjust the prime mover RPM to the desired frequency compensation (corner frequency roll-off) point. If UFRO LED is ON adjust the back panel UFRO trimmer anticlock wise to just OFF the LED If UFRO LED is OFF then adjust UFRO trimmer clockwise to turn ON LED and then anticlockwise to just turn it OFF.

Do I need VAR control on a single generator?

Many additional features enabled by digital technology (data monitoring,protective relaying,generator protection built in...) Don't use pure VAR control on single,isolated generator. Voltage control issues arise. Must be disabled when generator is not paralleled. Required for some but not every installation (specification driven).
