Next-generation approaches need to factor in the system value of electricity from wind and solar power - the overall benefit arising from the addition of a wind or solar power generation source ...

Mitigating climate change requires rapid growth of low-carbon electricity to substitute fossil fuels not only in power generation, but also in industry, transport, and other ...

Therefore, in this study, we complete a national complementarity analysis to identify areas in the U.S. that are particularly suited for wind-solar hybrid power plant development. We show the ...

Integrating the first few percentage points of variable renewables into generation poses few problems for most power systems. Beyond these levels however, power systems must be adapted and upgraded to take variable renewables ...

Renewable energy sources, notably wind, hydro, and solar power, are pivotal in advancing cost-effective power generation (Ang et al. 2022).These sources, being replenishable, do not emit harmful greenhouse ...

As modeled, wind and solar energy provide 60%-80% of generation in the least-cost electricity mix in 2035, and the overall generation capacity grows to roughly three times the 2020 level by ...

Electricity generation capacity. To ensure a steady supply of electricity to consumers, operators of the electric power system, or grid, call on electric power plants to produce and supply the right ...
