

Overview of voltage stability control in microgrids

What is microgrid stability?

Microgrids (MG) take a significant part of the modern power system. The presence of distributed generation (DG) with low inertia contribution, low voltage feede Microgrid Stability: A Review on Voltage and Frequency Stability | IEEE Conference Publication | IEEE Xplore Microgrid Stability: A Review on Voltage and Frequency Stability

Do microgrids need voltage regulation?

If the microgrid is large enough, voltage regulation may be required in order to avoid the nuisance of voltage relays tripping and cascade events. In Table 7 a set of candidate control strategies for the voltage control is summarized.

What causes voltage instability in microgrids?

Throughout the world, such incidents have been reported. Voltage instability is a result of the limits of DERs and the sensitivity of load power consumption to supplied voltage in microgrids. There may be voltage instabilities in these systems due to their low voltages in steady state and in dynamic states.

Do microgrid systems have small-signal transient and voltage stability?

The main contribution of this paper is an in-depth analysis of research in microgrid based on small-signal, transient, and voltage stability. The small-signal stability has been discussed based on uncertain load, limitation in power generation capacity, and nature of sluggish feedback observed in few microgrid systems.

What is the nature of microgrid?

The nature of microgrid is random and intermittent compared to regular grid. Different microgrid structures with their comparative analyses are illustrated here. Different control schemes, basic control schemes like the centralized, decentralized, and distributed control, and multilevel control schemes like the hierarchical control are discussed.

How to prevent microgrid instability?

The voltage and frequency stability during the system operation in the off-grid mode constitutes another difficult task to deal with. To mitigate the risk of microgrid instability, the electric energy balance needs to be ensured in the on-line environment.
