

# The temperature difference between the front and rear air inlets of the generator is too large

Why does a gas turbine engine need a higher temperature?

The higher temperature allows for increased power and improved efficiency while adding higher cost for the direct cooling of the first turbine stage airfoils and other components. The performance of the gas turbine engine is dependent on the mass of air entering the engine.

What temperature should a gas turbine engine be rated?

The majority of aircraft gas turbine engines are rated at standard day conditions of 59°F and 29.92 inches Hg. This provides a baseline to which gas turbine engines of all types can be compared. The need for high efficiency in the engine becomes more important as fuels become more costly.

What are the requirements for a gas turbine inlet temperature regulator?

The gas turbine inlet temperature regulator has strict requirements for the resistance of the air flow outside the tube. Generally, the operating resistance is required to be controlled below 150 Pa, which requires that the air flow speed should not be too high.

What is crease in gas turbine inlet temperature?

crease of the gas turbine inlet temperature. This has been vances. The turbine inlet gas temperature implicitly chamber. It is known that the temperature during steady allowable values at the turbine inlet. In other words, util- gas temperature. blades. To achieve this, it is needed to consider the hu- combustion chamber.

What is a high pressure gas turbine inlet temperature?

On modern, high performance aviation gas turbines, the high pressure turbine inlet temperatures are reaching nearly 3,600°F (2,000°C) during full power operation. Exhaust Gas temperatures in the jet pipe just aft of the last low pressure turbine stage are in the neighborhood of 1,000°F (550°C).

Does gas turbine efficiency increase with intake temperature?

Only when the intake temperature rises above 15 °, the gas turbine efficiency recovers the trend of increasing with the intake temperature. When the gas turbine runs at low load, the gas turbine efficiency tends to decrease first and then increase with the intake temperature.
