Can thermoelectrics convert solar energy into electricity?

Conventional wisdom is that thermoelectrics are most suitable for waste heat recovery and that materials with significantly higher ZT are needed for large-scale applications [7,22,23]. We will show that thermoelectrics are an attractive alternative for converting solar energy into electricity.

How is solar energy used to generate electricity?

Using solar energy to generate electricity can be done either directly and indirectly. In the direct method, PV modules are utilized to convert solar irradiation into electricity. In the indirect method, thermal energy is harnessed employing concentrated solar power (CSP) plants such as Linear Fresnel collectors and parabolic trough collectors.

Can photovoltaics and solar thermal power systems generate electricity?

While photovoltaics and solar thermal power systems are feasible approaches to generate electricity both for large-scale and off-grid applications over the daytime, they both rely on batteries or phase change materials to store electricity or heat at night [5,6], that drives up costs.

How is sunlight converted into electricity?

The conversion of sunlight into electricity has been dominated by photovoltaic and solar thermal power generation. Photovoltaic cells are deployed widely, mostly as flat panels, whereas solar thermal electricity generation relying on optical concentrators and mechanical heat engines is only seen in large-scale power plants.

How much solar energy can be converted into electrical energy?

Less than half of the solar energy can be converted into useful electrical energy by the most efficient existing multi-junction (MJ) PV cells. Consequently, more than half of the input solar energy is dissipated as heat.

How does solar thermal power work?

Solar thermal power systems use the Sun as a huge hot source and the surrounding environment as a cold sink to generate electricity. The Sun ( $\sim 5800$  K), the soil near the Earth's surface ( $\sim 290$  K) [9], and the outer space ( $\sim 3$  K) are three separate locations with a huge temperature difference.
